INS read receipt response

Overview

Notifications are sent by an HTTP POST request to the message URL that you specified on the INS Notifications tab.

The message parameters are passed as key => value pairs. Your message URLs should route to the script where you will be handling the message. You can listen for messages by simply setting up logic in your application to take action based on the message_type parameter that is passed in each message.

Validate response

Each notification message will include an MD5 hash that is computed using the secret word that you set up under in your Control Panel.

The hash is returned on each message through the md5_hash key.

Example message

Below is an example INS received caused by an event of order creation.

```json
{
  auth_exp =>
  bill_city => Columbus
  bill_country => USA
  bill_postal_code => 43215
